

Webinar Series: Strengthening Protected Area Management Effectiveness

Global-level syntheses have shown that effectively managed, adequately resourced protected areas are the best means to conserve biodiversity. However, today less than 10% of all protected areas are known to have been assessed for their effectiveness.

Evaluation of protected area management effectiveness (PAME) is recognized as a vital component of responsive, pro-active protected area management and is an essential component of adaptive management. PAME assessments are primarily important for improving management so that protected area objectives and conservation outcomes are met.

This four-part webinar series aims to strengthen and continue connections amongst protected area practitioners and those involved in the evaluation of management effectiveness for protected areas.

This series is part of the IUCN WCPA's "Vital Sites: The Journey to Marseille", a 6-month series of online events and multimedia content to run between June 2020 and the rescheduled World Conservation Congress in January 2021.

Target audiences

Protected area managers, conservation agencies, indigenous and local communities, national and regional level data providers, academics, donors and investment agencies, focal points for management effectiveness assessments and anyone with an interest in learning how and why we measure the effectiveness and performance of protected and conserved areas.

Registration links

Session 1

22 July 2020: Exploration of the different approaches and tools used in PAME around the world

https://dpensw.adobeconnect.com/pame1/event/event_info.html

Session 2

23 July 2020: Closing the loop – ensuring management effectiveness assessments lead to better conservation outcomes

https://dpensw.adobeconnect.com/pame2/event/event_info.html

Session 3

29 July 2020: The IUCN Green List – a standard for conservation of protected and conserved areas
